

## Two other Crypto Challenges

I wrote two other crypto challenges, redoing some of the cryptanalysis problems in [1]. Hope you enjoy it.

### Question One

Let us take a quick recap of the RSA cryptosystem before we proceed to the challenge.

RSA key generation

- 
- (1)Generate two large random primes,  $p$  and  $q$ . Compute  $n = pq$  and the Euler Totient Function  $\phi(n) = (p-1)(q-1)$ .
  - (2)Choose an integer  $e$ ,  $1 < e < \phi(n)$ , such that  $\gcd(e, \phi(n)) = 1$ .
  - (3)Compute  $d = \text{inverse}(e) \text{ modulo } \phi(n)$ .
- The public key is  $(e, n)$  and the private key is  $(d, n)$ .

Let  $P$  be the plaintext.

Encryption step

- 
- (4)Ciphertext  $C = P^e \text{ modulo } n$ .

Decryption step

- 
- (5)Plaintext  $P = C^d \text{ modulo } n$ .

Now,lets get down to the challenge.We know

$n=p*q=$

32687648385637537783640811354181874061215897978433332505893  
35723805895997818638115170716163092372015650633360675757735  
6348897777862803515902246025225890311618086597583349

and

$\phi(n)=3268764838563753778364081135418187406121589797843333$   
25058933572380589599781863803817965009542869443822608859310  
91253678968820310599119415741692715244067649854289986564236

It is known that either  $p$  or  $q$  has been used in other cryptosystems for key generation. Our task is to find the values of  $p$  and  $q$  and save the day!

## Solution to Question One

Congratulations to Furcalor for trying it out and solving it correctly.

Furcalor wrote:

Well anyway basically it goes like this

As you said:

n=  
326876483856375377836408113541818740612158979784333325058933  
572380589599781863811517071616309237201565063336067575773563  
48897777862803515902246025225890311618086597583349

phi(n)=32687648385637537783640811354181874061215897978433332  
505893357238058959978186380381796500954286944382260885931091  
253678968820310599119415741692715244067649854289986564236

So:

p=  
[n+1-phi(n)+sqrt((n+1-phi(n))^2-4n)]/2  
=  
769910660634180358352109076984911579855410179367854966867943  
645928713697465636771478367287

and q=  
[n+1-phi(n)-sqrt((n+1-phi(n))^2-4n)]/2  
=  
424564174221363706907547438219698980994087172322169073812681  
25196127025132651827

And to verify:

N=7699106606341803583521090769849115798554101793678549668679  
43645928713697465636771478367287  
\*  
424564174221363706907547438219698980994087172322169073812681  
25196127025132651827  
=  
326876483856375377836408113541818740612158979784333325058933  
572380589599781863811517071616309237201565063336067575773563  
48897777862803515902246025225890311618086597583349

End of Furcalor's comment.

Let us see if Furcalor's approach can be understood a little more systematically.

We have  $n=p*q$ .

$\phi(n)=(p-1)*(q-1)$   
 $\phi(n)=(p*q)-p-q+1$   
 $\phi(n)=n-(p+q)+1.$

Call  $(p+q)=2b$ , this is always true since  $p+q$  is even and hence 2 is a factor.  
Therefore,  $2*b=n+1-\phi(n)$  which can easily be found since  $n$  and  $\phi(n)$  are given.

All that remains is to find the roots of the quadratic equation  
 $x^2 - 2*b*x + n = 0$ , with sum of roots as  $2*b$  and product of roots as  $n$ .

The solutions are  
 $p,q=[ 2*b(+ \text{ or } -)\text{squareroot}( (4*b^2) - ( 4*n) )]/2$   
 $=b(+ \text{ or } -)\text{squareroot}(b^2 - n)$

P.S: We thank R.S for providing the large primes used in this challenge.

### Question Two

We know that our adversary is using a  $2*2$  enciphering matrix with a 29-letter alphabet scheme.

The conventional encodings are: [A-Z]=[0-25],  
blank\_space=26, ?=27, !=28.

We intercept the encrypted message

IK!UZ FM!FP (Note there are two blank\_spaces in between).

Since the message is signed by BOND, we know that

	B	N		<==>		M	F	
	O	D				!	P	

i.e.  $M==>B$ ,  $!==>O$ ,  $F==>N$ ,  $P==>D$ .

We also know that all encryptions are of the form:  
 $\text{Enc\_key} * \text{Plain\_Text} = \text{Cipher\_Text}.$

and all decryptions are of the form:  
 $\text{Dec\_key} * \text{Cipher\_Text} = \text{Plain\_Text}$

Find the Plain\_Text and save the day.

## Solution to Question Two

We know

$$\text{Dec\_key} * \begin{vmatrix} M & F \\ ! & P \end{vmatrix} = \begin{vmatrix} B & O \\ N & D \end{vmatrix}$$

or

$$\text{Dec\_key} = \begin{vmatrix} 1 & 13 \\ 14 & 3 \end{vmatrix} * \text{Inverse} \begin{vmatrix} 12 & 5 \\ 28 & 15 \end{vmatrix},$$

We know the Inverse of the Matrix is the Adjont of the matrix divided by its determinant. Therefore,

$$\text{Inverse} \begin{vmatrix} 12 & 5 \\ 28 & 15 \end{vmatrix} = (1/11) * \begin{vmatrix} 15 & 24 \\ 1 & 12 \end{vmatrix} = \begin{vmatrix} 4 & 18 \\ 8 & 9 \end{vmatrix}$$

Therefore,

$$\text{Dec\_key} = \begin{vmatrix} 1 & 13 \\ 14 & 3 \end{vmatrix} * \begin{vmatrix} 4 & 18 \\ 8 & 9 \end{vmatrix} = \begin{vmatrix} 21 & 19 \\ 22 & 18 \end{vmatrix}$$

We now retrieve the Plain\_Text as follows:

We know

$$\begin{vmatrix} I & ! \\ K & U \end{vmatrix} = \begin{vmatrix} 8 & 28 \\ 10 & 20 \end{vmatrix}$$

Therefore,

$$\text{Dec\_key} * \begin{vmatrix} 8 & 28 \\ 10 & 20 \end{vmatrix} = \text{Plain\_Text1}$$

$$\begin{array}{|c|c|c|c|c|c|c|c|c|c|c|c|} \hline 21 & 19 & * & 8 & 28 & = & 10 & 11 & = & K & L & \\ \hline 22 & 18 & & 10 & 20 & & 8 & 19 & & I & T & \\ \hline \end{array}$$

We also know,

$$\begin{array}{|c|c|c|c|c|c|c|c|} \hline Z & \text{blank} & = & 25 & 26 & \\ \hline \text{blank} & F & & 26 & 5 & \\ \hline \end{array}$$

Therefore,

$$\text{Dec\_key}^* \begin{array}{|c|c|c|} \hline 25 & 26 & \\ \hline 26 & 5 & \\ \hline \end{array} = \text{Plain\_Text2}$$

$$\begin{array}{|c|c|c|c|c|c|c|c|c|c|c|c|} \hline 21 & 19 & * & 25 & 26 & = & 4 & 3 & = & E & D & \\ \hline 22 & 18 & & 26 & 5 & & 3 & 24 & & D & Y & \\ \hline \end{array}$$

Concatenating Plain\_Text1 and Plain\_Text2, we get KILTEDDY ,which is to be read as KIL TEDDY as signed by BOND.
